

Deer Recruitment Survey-2008

IFW would like your help counting turkey broods and adult doe/fawn numbers.

August marks the time when deer fawns are becoming more active and independent. It is an appropriate time to gauge the numbers of fawns and adult does in order to see how the herd is fairing. Please make note of the number of adult females and their young that you see during the month of August.

NOTE: When sighting deer, be careful to identify adult does from fawns. Adult does have longer noses and foreheads, long-rectangular bodies, and long necks. On the other hand fawns have short noses and foreheads, short-square bodies, and shorter necks. In some cases spots on fawns may be fading, so body shape and size is really important to differentiate
